String ends with?

Complete the solution so that it returns true if the first argument(string) passed in ends with the 2nd argument (also a string).

Examples:

```
strEndsWith('abc', 'bc') -- returns true
strEndsWith('abc', 'd') -- returns false
```

My solution:

```
export function solution(str: string, ending: string): boolean {
  if (str.substring(str.length - ending.length) == ending) { return true }
  return false; // TODO: complete
}
```

Best practice

```
export function solution(str: string, ending: string): boolean {
  return str.endsWith(ending);
}
```

The best practice implements the inbuilt function `.endsWith()` which fulfils the purpose of the task
